

ABSTRACT

The invention relates to a mobile deliveries data acquisition device comprising a reader (2) of machine-readable data concerning objects to be delivered and an input system of recipient-identifying data, further an accessory module for the delivery process of a mobile data acquisition device. Such a known mobile data acquisition device or an accessory module for such a device is improved by the invention with respect to complexity of data processing and recipient identification in that the input system is designed as the reader (3) for machine-readable recipient identifications.
